**Wi Columns and panel**

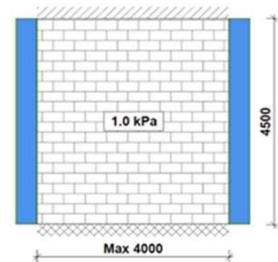

\* Design Examples

Note:  
Wi Columns provide simple support to panel

Note:  
Wi Columns provide simple support to panel

Note:  
Wi Columns provide simple support to panel

**Notes:**

The above tables are based on unreinforced walls and 7.3 N/mm<sup>2</sup>, 1450 kg/m<sup>3</sup> density Wi Slot Blocks.  
 Maximum spacing valid for non-load bearing wall panels, simply supported on sides and top, fixed at the bottom.  
 Based on vertical ties at 450 centres & head restraints at 900 centres as standard.  
 Wall panels with openings have reduced capacity, maximum allowable spacing may change.  
 These tables are for general guidance. Panel and Wi Column design should be completed by a qualified civil or structural engineer.

6500	3250	11000	10000	5500	4000
7000	3500	11000	8000	5000	3800

### Wall panel and Wi Beam

\*Design Examples

**Notes:**

The above tables are based on unreinforced walls up to 7 m and incorporating 3.5 mm  $\phi$  BJR at 450 centres for longer walls.

Based on 7.3 N/mm<sup>2</sup>, 1450 kg/m<sup>3</sup> density Wi Slot Blocks.

Maximum panel sizes valid for non-load bearing wall panels, simply supported on all four sides.

Based on vertical ties at 450 centres & head restraints at 900 centres as standard.

Wall panels with openings have reduced capacity, maximum panel size may change.

These tables are for general guidance. Panel and Wi Beam design should be completed by a qualified civil or structural engineer.

5000	2500	6000	3000	2200	1800

**Wall panel and Wi Beam**

\*Design Example

**Example using multiple 190 Wi Beams**

**Notes:**

This example utilises 3 No. Wi Beams to laterally restrain a 190 mm wall 9 m long and 12 m high subject to a lateral pressure of 0.5 kPa.

The Wi Beams are checked against the allowable load tables for panel heights of 3m and length of 9 m.

The panels have been checked with the incorporation of 3.5 mm  $\phi$  bed joint reinforcement at 450 centres.

**Notes:**

The above tables are based on unreinforced walls up to 7 m and incorporating 3.5 mm  $\phi$  BJR at 450 centres for longer walls.

Based on 7.3 N/mm<sup>2</sup>, 1450 kg/m<sup>3</sup> density Wi Slot Blocks.

Maximum panel sizes valid for non-load bearing wall panels, simply supported on all four sides.

Based on vertical ties at 450 centres & head restraints at 900 centres as standard.

Wall panels with openings have reduced capacity, maximum panel size may change.

These tables are for general guidance. Panel and Wi Beam design should be completed by a qualified civil or structural engineer.
